

# Sonus WebRTC Service Solution and Deployment Guide

Sonus WebRTC Services Solution enables web browsers to participate in audio, video, and data communications without any plug-ins, applications, or downloads of any kind. With a WebRTC-compatible web browser, you can place a call to a contact center, participate in a multi-party video conference, or engage in a screen sharing collaboration with colleagues without requiring special hardware or client software on your computer or mobile device. WebRTC-based services open up the whole world of Unified Communications (a suite of integrated voice, video, data, and text communications delivered through SIP) to anyone with a web browser and internet connection.

The following figure describes the components involved in WRTC solution and their interfaces:

**Figure 1:** WRTC Solution

The Sonus WebRTC Services Solution guide describes about Sonus WebRTC software architecture, components, features and functions, WRTC web applications, cloud management, and deployment scenarios in detail.
