- The SBC Edge Acts as an ICE Agent
- Translating SIP Responses in SIP-SIP Calls Using 'Pass-thru Peer SIP Response Code'
- Translating SIP Responses in SIP-SIP Calls Using the Pass-thru Peer SIP Response Code
- Use of Calling Extension in Transformation Table for ext=xxxx Input Value
- Using Lync Setup for E911 Configuration
- Verifying Downloads With Checksum
- Working with SIP Signaling Groups and NAT
- Working with the ASM and SBA

This section contains a collection of articles which explore supported ways of configuring and deploying SBC Edge using a range of existing and new features.

The intent is to encourage field engineers, customers, and partners to adopt these best practices to help them improve existing techniques used for configuring and deploying SBC Edge in their VoIP and networking topology.

In addition to configuration procedures, some of these articles contain in-depth verification steps to help you solve common deployment scenarios using methods that are supported and have been tested by Sonus.

These articles are applicable to [the latest version of Sonus SBC Edge](#) and assumes the reader has a solid understanding of Unified Communications concepts in addition to training on Microsoft Unified Communication Applications:
