

GET natportforward id

REST API Method: **GET /rest/natportforward/{identifier}**

Retrieves all resource schema elements and values of a NAT Port Forward Table based on a requested Table ID. Valid IDs are from 1 to 20 (inclusive).

 If no Table ID is specified in the GET, a listing of all NAT Port Forward entries will be returned along with their associated Table IDs. These table identifiers can be used to collect resource schema element values via the [GET natportforward id](#) method.
