
GET spmmessagetable id - spmstatuslinerule

REST API Method: GET

[/rest/spmmessagetable/{identifier}/spmstatuslinerule](#)

Retrieves all resource schema elements and values of a Status Line Rule based on a requested Table Entry ID in a given [Message Table](#).

If no Table Entry ID is specified in the GET, a listing of all Status Line Rules will be returned along with their associated Table Entry IDs. A Message Table may contain [Header Rules](#), [Request Line Rules](#), and [Status Line Rules](#): all will need to be queried to determine the message table membership. These table entry identifiers can be used to collect resource schema element values via the [GET spmmessagetable id - spmheaderrule id](#) method.
