

Analytics Director 20.x

Analytics Director provides two main functions:

- Creation of Configuration Drives (.iso) required for deploying the Ribbon Analytics cluster on KVM, VMware, and AWS platforms. The generated Configuration Drive is downloaded and transferred to a VM host for Ribbon Analytics VM creation.
- Installation of Ribbon Analytics. In release 20.10 and earlier, Analytics Director provides a CLI for automated installation of Ribbon Analytics on KVM. In release 20.12, the Analytics Director UI automates the installation of Ribbon Analytics on KVM and VMware.

Availability: Since 20.12

The Analytics Director UI is an easy-to-use interface that can be accessed through any standard browser.

What would you like to do?	
Create or manage a Configuration Drive	Use Analytics Director to create or manage the Configuration Drive required to install or upgrade Ribbon Analytics on KVM or VMware.
Install Analytics Director on KVM	If you do not have access to the Ribbon-hosted Analytics Director UI, install it on a KVM host in your network.
Install Analytics Director on VMware	If you do not have access to the Ribbon-hosted Analytics Director UI, install it on a VMware host in your network.
Install Analytics Director on AWS	If you do not have access to the Ribbon-hosted Analytics Director UI, install it on AWS.
